**DECANAL<sup>®</sup>**  
**250**

Nandrolone Decanoate is an anabolic steroid. Nandrolone decanoate is used in the treatment of osteoporosis in postmenopausal women (though now not recommended) at a dose of 50 mg every three weeks. It is also used for some aplastic anemias. The positive effects of the drug include muscle growth, appetite stimulation and increased red blood cell production and bone density. Clinical studies have shown it to be effective in treating anaemia, osteoporosis and some forms of neoplasia including breast cancer, and also acts as a progestin-based contraceptive.

Nandrolone is not broken down into DHT, the deleterious effects common to most anabolic steroids on the scalp, skin, and prostate are lessened to a degree, but is rather broken down to the much weaker androgen dihydronandrolone. The lack of alkylation on the 17 $\alpha$ -carbon drastically reduces the drug's liver toxicity. Estrogenic effects resulting from reaction with aromatase are also reduced due to lessened enzyme interaction but effects such as gynaecomastia and reduced libido still occur in larger doses because of other mechanisms. Other side-effects of abuse can include erectile dysfunction and cardiovascular damage, as well as several ailments resulting from the drug's effect of lowering levels of luteinizing hormone through negative feedback. Erectile dysfunction is attributed to the weaker action of dihydronandrolone in the penis since dihydrotestosterone is a known sexual modulator.

**ANABOLIC/ANDROGENIC RATE**  
Anabolic/Androgenic rate of Nandrolone Decanoate is 125:37

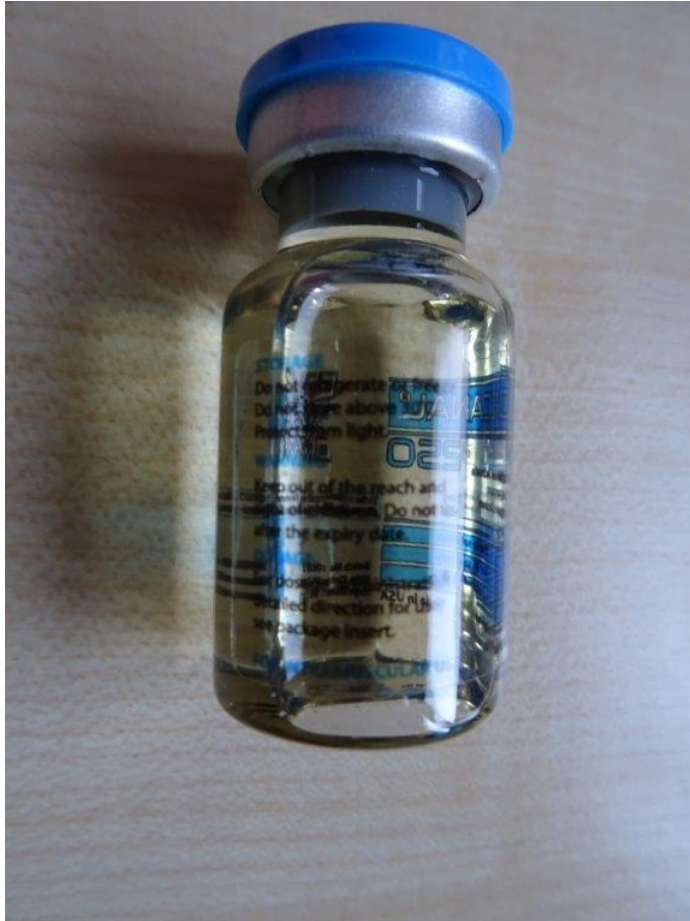

**DOSAGE**  
For men: 200-600mg/week. For women: 50-100mg/week.

**HALF-LIFE**  
Half-Life of Nandrolone Decanoate is 15 days.

**DETECTION TIME**  
Nandrolone Decanoate detection time is 18 months.

**ORIGINAL LABS**

**TESTO ENANTHATE 250**

Testosterone is a steroid hormone from the androgen group and is found in humans and other vertebrates. In humans and other mammals, testosterone is secreted primarily by the testes of males and, to a lesser extent, the ovaries of females. Small amounts are also secreted by the adrenal glands. In men, testosterone plays a key role in the development of male reproductive tissues such as the testes and prostate, as well as promoting secondary sexual characteristics such as increased muscle and bone mass, and the growth of body hair. In addition, testosterone is essential for health and well-being as well as the prevention of osteoporosis.

In general, androgens promote protein synthesis and growth effects can be classified as virilizing and anabolic, though the distinction is somewhat artificial, as many of the effects can be considered both.

Anabolic effects include growth of muscle mass and strength, increased bone density and strength, and stimulation of linear growth and bone maturation.

Androgenic effects include maturation of the sex organs, particularly the penis and the formation of the scrotum in the fetus, and after birth (usually at puberty) a deepening of the voice, growth of the beard and axillary hair. Many of these fall into the category of male secondary sex characteristics. Testosterone effects can also be classified by the age of usual occurrence. For postnatal effects in both males and females, these are mostly dependent on the levels and duration of circulating testosterone.

**ANABOLIC AND ANDROGENIC EFFECTS**  
For 100-200 mg of Testosterone Enanthate in 100-100

**HALF-LIFE**  
Half-Life of Testosterone Enanthate is 15 days.

**DETECTION TIME**  
Testosterone Enanthate detection time is 3 months.

# TESTO ENANAL 250

Testosterone is a steroid hormone from the androgen group and is found in humans and other vertebrates. In humans and other mammals, testosterone is secreted primarily by the testes of males and, to a lesser extent, the ovaries of females. Small amounts are also secreted by the adrenal glands. It is the principal male sex hormone and an anabolic steroid. In men, testosterone plays a key role in the development of male reproductive tissues such as the testis and prostate as well as promoting secondary sexual characteristics such as increased muscle and bone mass, and the growth of body hair. In addition, testosterone is essential for health and well-being as well as the prevention of osteoporosis.

In general, androgens promote protein synthesis and growth of those tissues with androgen receptors. Testosterone effects can be classified as virilizing and anabolic, though the distinction is somewhat artificial, as many of the effects can be considered both.

Anabolic effects include growth of muscle mass and strength, increased bone density and strength, and stimulation of linear growth and bone maturation.

Androgenic effects include maturation of the sex organs, particularly the penis and the formation of the scrotum in the fetus, and after birth (usually at puberty) a deepening of the voice, growth of the beard and axillary hair. Many of these fall into the category of male secondary sex characteristics.

Testosterone effects can also be classified by the age of usual occurrence. For postnatal effects in both males and females, these are mostly dependent on the levels and duration of circulating free testosterone.

**ANABOLIC/ANDROGENIC RATE**  
Anabolic/Androgenic rate of Testosterone Enanthate is 100:100

**DOSAGE**  
For men: 250-1500mg/week. For women: Not recommended.

**HALF-LIFE**  
Half-Life of Testosterone Enanthate is 15 days.

**DETECTION TIME**  
Testosterone Enanthate detection time is 3 months.

## TESTO PROPIONATE 100

Testosterone Propionate is a pure testosterone hormone. Although synthetic it is a perfect replica of the primary naturally produced male androgen testosterone. By design, the hormone is attached to the Propionate (propionic acid) ester, a small/short ester that regulates the hormone's release time to be controlled. Without an ester, the hormone would disperse and dissipate rapidly post administration. By attaching the ester, this promotes a controlled release and allows the individual to inject the hormone less frequently. Once Testosterone Propionate is injected, the ester slowly begins to detach from the hormone. As the ester is detached the testosterone hormone begins to release into the blood. The half-life of Testosterone Propionate is approximately three days, which is substantially longer than ester free testosterone, which carries a half-life a little less than 24 hours.

Anabolic effects include growth of muscle mass and strength, increased bone density and strength, and stimulation of linear growth and bone maturation.

Androgenic effects include maturation of the sex organs, particularly the penis and the formation of the scrotum in the fetus, and after birth (usually at puberty) a deepening of the voice, growth of the beard and axillary hair. Many of these fall into the category of male secondary sex characteristics. Testosterone effects can also be classified by the age of usual occurrence. For postnatal effects in both males and females, these are mostly dependent on the levels and duration of circulating free testosterone.

### ANABOLIC/ANDROGENIC RATE

Anabolic/Androgenic rate of Testosterone Propionate is 100:100

### DOSAGE

For men: 50-100mg/day. For women: Not recommended.

### HALF-LIFE

Half-Life of Testosterone Propionate is 3 days.

### DETECTION TIME

Testosterone Propionate detection time is 3 weeks.

## TESTO PROPIONAL<sup>®</sup> 100
