**NATIONAL GUIDELINE TO MARKETING AUTHORISATION HOLDERS FOR THE RECLASSIFICATION
OF A MEDICINAL PRODUCT FOR HUMAN USE FROM “SUBJECT TO MEDICAL PRESCRIPTION” TO “NOT
SUBJECT TO A MEDICAL PRESCRIPTION”**

1. Legal Framework

Recital 32 of Directive 2001/83/EC refers to ‘It is appropriate, as an initial step, to harmonise the basic principles applicable to the classification for the supply of medicinal products in the Community or in the Member States concerned, while taking as a starting point the principles already established on this subject by the Council of Europe as well as the work of harmonisation completed within the framework of the United Nations, concerning narcotic and psychotic substances’.

Article 70 of Directive 2001/83/EC (Article 29 of the Medicines Act, 2003 and Regulation 26 of the Medicines (Marketing Authorisation) Regulations) provides two classifications for the supply of medicinal products for human use in the Community:-

- “medicinal products subject to medical prescription”
- “medicinal products not subject to medical prescription”

Article 71 of Directive 2001/83/EC (Regulation 27 of the Medicines (Marketing Authorisation) Regulations) provides the criteria for classifying a medicinal product as subject to medical prescription. Thus a medicinal product which meets these criteria is subject to a medical prescription and a medicinal product which does not meet these criteria is not subject to a medical prescription, as stated in Article 72.

Classification of a medicinal product as not subject to a medical prescription should not be considered whenever the criteria in Article 71 of Directive 2001/83/EC (Regulation 27 of the Medicines (Marketing Authorisation) Regulations) and Article 3.3 of Directive 2001/83/EC (Article 19 (2) (c) of the Medicines Act, 2003) apply, subject to Article 71; according to Article 71(4) of Directive 2001/83/EC a medicinal product, which meets any of the criteria for supply subject to medical prescription, may be classified for supply not subject to medical prescription if: *“the maximum single dose, the maximum daily dose, the strength, the pharmaceutical form, certain types of packaging and/or other circumstances of use, can make supply without medical prescription appropriate.”*

2. Scope

This guideline is for use by marketing authorisation holders applying for a national change in the legal classification for supply of a medicinal product from “subject to medical prescription” to “not subject to a medical prescription”.

3. Principles and procedure

This guideline applies to National and European approved products in Malta **only**. These include products authorised via the Decentralised/Mutual Recognition Procedures and National Marketing Authorisation Procedures including Parallel Import products and products authorised via Article 126(a) of Directive 2001/83/EC.

Parenteral products are subject to a medical prescription and will not be considered for switching, because of the additional risks and complexity of the route of administration.

A variation must be submitted with an updated expert report in order to switch a medicinal product from “subject to medical prescription” to “not subject to a medical prescription”. The updated expert overview should be submitted in line with the requirements described later on in this guideline.

Mock-ups of the product information and the proposed name should be submitted with the initial application. In the case of shared packs with other member states (MS), any pending variations relating to name changes in these MS should be finalised before submission of a reclassification in

Malta.

In cases where both the “subject to medical prescription” and “not subject to a medical prescription” are to remain on the market then a new MA number is assigned to each product and these products may be required to have distinct and separate packaging.

Criteria for classifying a medicinal product as subject to a medical prescription or not

The information below should be taken into consideration by the applicant when applying for a switch:

Safety

Medicinal products shall be subject to medical prescription when they are likely to present a danger either directly or indirectly, even when used correctly, if utilised without medical supervision. A direct danger when the product is used correctly and in accordance with the patient information encompasses toxicity, interactions and adverse reactions.

A medicinal product not subject to a medical prescription should have low general toxicity and no relevant reproductive toxicity, genotoxic or carcinogenic properties. The medicinal product should also have no interactions with commonly used medicines which can produce serious adverse reactions. The safety of a medicinal product is relative to that of the alternative treatment.

An example of indirect danger, even when the product is used correctly, that is to say used according to the patient information, would be where symptomatic treatment might mask/hide an underlying condition requiring medical attention and supervision. Use of the medicine might delay diagnosis and definitive treatment and jeopardise the chance of more successful therapy. A time limit beyond which, if symptoms persist, medical advice should be sought should be included in the product information. Medicinal products not subject to a medical prescription should be approved primarily for short term treatment, e.g. when the possibility of “masking” could occur.

An indirect danger is also present if wider use of a medicinal product would increase the risk of resistance to the product, in particular in the general population, to such an extent that the usefulness of any medicinal product is likely to be compromised; or if the symptom is commonly the outward manifestation of a diverse range of underlying pathologies and where the patient cannot easily discern the underlying disease.

Self-assessment

(a) It is important that the condition or symptoms, for which a medicinal product not subject to a medical prescription is indicated, can be correctly assessed by the patient and that the product can be used without medical supervision. This means that the patient should be capable of excluding conditions which could appear to be similar to the indications but unsuitable for treatment with the medicine in question.

Account may be taken of the availability of appropriate information sources that would assist the patient in achieving this, including written information or the advice of pharmacist and other health care professionals.

(b) The natural course of the disease, the condition, the duration of symptoms and their reoccurrence and consequences due to this should be correctly self-assessable.

(c) Contraindications, interactions, warnings and precautions should be those which can be understood by the patient.

Risk and consequences of incorrect use

It is important that the danger to health is small, if the patient uses the product where it is not indicated, uses it for a longer period than recommended, exceeds the recommended dose or fails to heed warnings or contraindications. Consideration of the consequences of misuse is an important component of the overall safety profile of the medicinal product which should be reflected in the label (as provided for in Article 54 (g) and (n) of Directive 2001/83/EC (Regulation 3 (g) and (n) of the Medicinal Products (Labelling and Packaging) Regulations). and/or the package leaflet.

Data requirements

a) Products authorised in Malta as “subject to a medical prescription” and already authorised in another EU state as “not subject to a medical prescription”

In cases where the product is already approved as “not subject to a medical prescription” in another EU state then a type II simple national variation may be submitted in line with the requirements established below;

- An updated expert overview with a critical analysis of the proposed availability of the product without a medical prescription with the dose and indications as already authorised, unless the pack size or the strength is decreasing. The safety profile of the drug should be discussed and reports from post-marketing surveillance studies, clinical trials and published literature should be presented, unless otherwise justified. Information on adverse drug reactions should be provided including experience of use without medical supervision in another EU state.
- The product information including mock-ups should be presented with all the points listed in the section “*ii) Product information*” of this guideline clearly adhered to.
- Proof of the legal status as “not subject to a medical prescription” in the said EU country should also be provided.

The variation will follow the type II simple timetable and the same fees apply.

b) Products authorised in Malta as “subject to a medical prescription” for which a switch to “not subject to a medical prescription” is requested

The submission should be classified as a type II complex variation which will follow the same timeline and the same fee requisites. In order to facilitate the evaluation of safety in relation to benefit it should be presented in a logical and concise manner as shown below.

An updated expert overview

The expert should provide a critical analysis of the proposed availability of the product without a medical prescription with the dose and indications as already authorised, unless the pack size or the strength is decreasing. The expert should take a clear position, support the switch in light of current scientific knowledge and demonstrate why none of the criteria (with respect to safety) that determine classification for supply subject to a medical prescription apply to the product.

The following must be taken into consideration and discussed in the expert overview:

i) Safety

(a) Experience in terms of patient exposure to the substance needs to be considerable and should be outlined. Normally, active substances which are suitable for supply without a medical prescription will have been in widespread use for five to ten years in EU countries, in medicinal products subject to a medical prescription. Adverse reactions related to the pharmaceutical form and/or posology and strength proposed for supply not subject to a medical prescription should in normal conditions be minor and should cease on discontinuing therapy.

(b) Information on adverse reactions should be provided, including experience of use without medical supervision, for example in another Member State or in a third country. Variables such as numbers of patients treated, demographic details, indications for use and dose should be provided and taken into account in providing and interpreting the data.

(c) The safety profile should be summarised according to EU guidelines, including reports of and data from post-marketing surveillance studies, clinical trials and recent published literature presenting the issue of drug safety. Information concerning serious adverse reactions should be given and discussed. The problems of extrapolating data from the population, using the active substance supplied only on a medical prescription, to the population using it without a medical prescription should be presented and discussed.

(d) The application should consider the potential for and consequences of drug interactions, in particular with commonly prescribed drugs.

(e) The application should consider the consequences concerning misuse, e.g. use for longer periods than recommended, as well as accidental or intended overdose and the use of higher doses, should be discussed.

(f) The application should consider the consequences of the use of the product by a patient who has incorrectly assessed his condition or symptoms.

(g) The application should consider the consequences of incorrect or delayed diagnosis of a patient's condition or symptoms due to self medication with the product.

(h) A suitable time-period for treatment of the suggested indication(s) should be justified and given together with a proposed pack size.

ii) Product information

The way in which a medicinal product not subject to medical prescription is used is likely to differ from the way the same product was used when available only on prescription, even when the indications are the same or in the same therapeutic area. There is also the risk that the patient will consider the medicinal product not subject to

a medical prescription as being safer than when the same product is subject to a medical prescription.

For a medicinal product classified for supply without a medical prescription, the proposed labelling and package leaflet are important elements of the application and will be closely examined for comprehensive information and effectiveness in protecting patients from any safety hazards. For this reason:

(a) The written information (package leaflet and label) must contribute effectively to safe and effective use of the medicine. The correct use of the medicine should be explained in the information. It is necessary to consider if the information is clear enough for the patients to use the medicine appropriately. This information should be sufficient so that it substitutes for the absence of medical supervision.

(b) The written information supplied with the medicine, in addition to the supervision of the pharmacist when applicable, should be adequate to guard against a risk of using the product where it is contraindicated or unsafe. Contraindications, interactions, warnings and precautions need to be clearly described in layman's terms and prominently presented in the leaflet. The package leaflet must reflect the current safety knowledge of the active pharmaceutical ingredient concerned.

(c) In order to minimise risk and maximise benefit, the leaflet and the label should describe the situations where the product should not be used, in at least as much detail and prominence as to when it may be used and in accordance with the summary of product characteristics.

(d) Package leaflets should provide information on/ appropriately describe the use of the product and the circumstances when referral for medical advice is appropriate.

(e) The outer packaging or, where there is no outer carton, the immediate packaging should include instructions for use in the case of non-prescription medicinal products, as required by Article 54 (n) of Directive 2001/83/EC (Regulation 3 (n) of the Medicinal Products (Labelling and Packaging) Regulations).

(f) Contraindications and warnings, such as advice limiting duration of treatment or the need to consult a doctor in certain situations, should be provided as appropriate.

(g) This product information, on the label and in the leaflet, should be readable, see the *Guideline on the readability of the label and package leaflet*. If the MAH has carried out a user testing on the package leaflet to be used for the “not subject to a medical prescription” medicine then it is recommended to submit this report for evaluation.

Pack size and package form (container)

(a) The pack size should be decided in relation to the intended length of the treatment. Restricting the availability of a medicinal product to a small pack size is a possible safeguard against misuse, particularly overdose, or a delay in seeking medical attention.

(b) Medicinal products should have a container which as far as possible prevents

children gaining access to the medicine, if they get hold of the container.

Maximum dose, maximum daily dose

Restricting the maximum dose or maximum daily dose may protect against potential danger whether the medicine is used correctly or incorrectly. However, it is necessary to confirm that the reduced dose retains the efficacy.

Other

A related change of container or packaging material should be discussed when applicable, together with necessary documentation.

Name of the product

It is up to the applicant in the case of a switch from 'prescription' to 'non-prescription' status of an already authorised medicinal product to choose whether to retain the same invented name or to choose a new invented name. If a new invented name is to be used it is important not to have suffixes and prefixes included in the proposed name that imply an advantage or enhanced mode of action or efficacy which is not in accordance with the approved summary of the product characteristics.
